Your CRM Lead Response Playbook

New leads, conversations, pipeline, and outcome reporting

Abstract: Your operating manual for the CRM: what happens automatically when a lead comes in, what to do when they reply, and how logging outcomes feeds directly into better leads.

Waiz Media • Client Success

September 2026

What's inside

Ten chapters, in the order a lead actually moves through your CRM. Read it once at launch, then come back to the chapter you need.

Chapter	What you will know when you finish it
1. Welcome	The job of this CRM, and the split: Waiz captures the lead and starts the conversation. You take it from the first reply.
2. Your CRM at a glance	The four places you will actually use (Conversations, Contacts, Opportunities, Calendars) and how to get the LeadConnector app on your phone so a new lead is one tap from a call.
3. When a new lead comes in	What fires the moment someone submits your ad: the contact is created, you are notified, and the lead lands in New Lead. Why calling inside five minutes is the whole game.
4. How the automated follow-up works	The texts adapt to what the lead asked about, and they are sent as your assistant so nothing speaks for you before you have. The sequence stops the instant they reply.
5. When the lead responds	Where to read and answer (the Conversations tab, on desktop or in the app), and why every message after the first reply is yours to send.
6. Your pipeline	What each stage means, which two moves happen automatically, how to drag a lead as it heats up or cools off, and how to add stages of your own without breaking the ones we set up.
7. Tags: the only two you need	Add claimed after a real conversation so we can see your contact rate. Add kill-switch to shut off every automated message for that contact. Deal results are not tags.
8. The contact record	Where the form answers already live, which custom fields to fill as you learn more, and the note to leave after every real conversation so the next call starts warm.
9. Logging outcomes	How to report a proposal, a submission, or a funded deal, and how to log a disqualification with the real reason. Those two minutes are what let us send you better leads.
10. Daily rhythm, guardrails, and fixes	The few minutes each day that keep the book current, the settings to leave alone, and what to do when a notification is missing or a text will not stop.

Welcome

This playbook is your operating manual for the CRM we set up for you. It walks through the full life of a lead: what happens automatically the moment someone submits your ad form, what you need to do when they reply, and how your updates feed directly back into better campaigns and better leads.

The system is built around one simple split. We capture the lead and start the conversation. You take it from there.

Figure 1: The working split between Waiz and you.

The one rule that matters most: speed. Leads answer the person who reaches them first. Every section in this playbook exists to help you respond in minutes, not hours.

Your CRM at a glance

Everything happens in one place. On desktop, the left navigation gives you the four areas you will actually use:

- **Conversations** – every text thread with every lead, in one inbox
- **Contacts** – the full record for each lead: info, fields, notes, tags
- **Opportunities** – your pipeline board, where leads move through stages
- **Calendars** – appointments, if you book calls through the system

Get the mobile app

Download **LeadConnector** so you can call and text leads the moment they come in, from anywhere. Log in with the same email and password as your desktop login.

- **iPhone / iPad:** search "Lead Connector" on the App Store
- **Android:** search "Lead Connector" on Google Play

Turn on push notifications when the app asks. This is how you find out about a new lead within seconds.

When a new lead comes in

The moment someone submits your ad form, three things happen automatically: the contact is created in your CRM, you get a notification, and the lead lands in your pipeline under **New Lead**.

Figure 2: The life of a lead: the top row is automatic, the bottom row is yours.

Here is what that looks like in your pipeline. The new lead appears as a card in the first column, with its source and details attached:

Figure 3: A new lead lands in the New Lead stage of your pipeline.

Call within 5 minutes. Contact rates fall off a cliff after the first few minutes. When the notification hits your phone, open the contact and dial. The app makes this a two-tap motion.

How the automated follow-up works

While you are getting to the phone, the system is already working. The lead receives a first text within about five minutes of their inquiry, and a short follow-up sequence continues on schedule until they respond.

Two things make this sequence different from a generic drip:

1. **It adapts to intent.** The messaging changes based on what the lead actually expressed on the form, so the follow-up speaks to what they asked about rather than sending everyone the same script.
2. **It speaks as your assistant.** Messages are sent on behalf of your assistant, not as you. That way nothing puts words in your mouth or represents you incorrectly before you have personally spoken with the lead.

Figure 4: The follow-up sequence in plain terms: it works until the lead replies, then hands off to you.

The drip has exactly one job: start the conversation. It is not a replacement for calling. The leads that turn into business are almost always the ones who got a call fast *and* a text fast.

When the lead responds

The moment a lead replies, two things happen automatically: the follow-up sequence stops (no double-texting, no robot talking over you), and the lead moves to the **Contacted** stage in your pipeline.

From this point forward, every reply is yours. Go to the **Conversations** tab to read and respond. Keeping replies inside the CRM keeps the entire history of the lead in one thread, on desktop and in the mobile app.

Figure 5: The Conversations tab: your inbox for every lead. Select a thread to read the history and reply.

Reply fast here too. A lead who texts back is live right now. Minutes matter as much on the reply as they do on the first call.

Your pipeline

The pipeline lives under **Opportunities** in the left navigation. It is your at-a-glance view of where every lead stands.

Stage	What it means	Who moves it
New Lead	Just came in, not yet reached	Automatic
Contacted	Lead replied or you connected	Automatic on reply
Hot	Engaged and moving toward a deal	You
Nurturing (3–6 Months)	Real interest, longer timeline	You

Short to Close	Deal in motion, closing soon	You
----------------	------------------------------	-----

The first two moves are automatic. Everything after that is you: as a lead heats up, cools down, or moves toward closing, drag the card to the stage that matches. Thirty seconds of pipeline hygiene per lead keeps your whole book organized.

Want more granularity? You can add your own stages under pipeline settings. Just keep the stages we set up intact: do not rename or delete them, because the automation and reporting depend on them.

Tags: the only two you need

Tags in this system are deliberately simple. You will only ever add two, and each one takes two seconds from the contact record.

claimed

"I had a real conversation with this lead."

Tracks your contact rate and lead quality.

kill-switch

"Stop every automated message for this contact."

Use when a lead should not be texted again.

Everything else (proposal, submitted, funded, DQ) goes in the Client Log form

Figure 6: The two tags you own, and what each one does.

Add **claimed** whenever you have had a real conversation with a lead: a call that connected or a genuine text exchange. This is how we measure your contact rate together, and it is the single most useful signal for judging lead quality.

Add **kill-switch** when a contact should receive no automated messages at all: they asked to stop, they became a client, or any other reason. It shuts off everything instantly.

Deal outcomes are not tags. Proposals, submissions, funded deals, and disqualifications are all reported through the Client Log form on the next page.

The contact record: fields and notes

Select any contact to open their full record. The basics (name, phone, email, source, and their form answers) fill in automatically from the ad. Two areas are yours to maintain:

- **Custom fields** (left panel of the contact) – update these as you learn more: timeline, amounts, qualification details. Structured data here means you never have to re-ask a question.
- **Notes** – after every real conversation, leave a short note: what was said, any objections, and the agreed next step. Future-you will thank present-you every time a lead calls back three weeks later.

Use the fields we set up first. If you feel a field is missing, tell us before creating your own so the data stays clean and reportable.

Logging outcomes: the Client Log

This is the highest-leverage two minutes in the whole system. Every deal outcome is reported through the **Client Log** form. There are two event types.

Conversions

When a lead reaches **Proposal**, **Submitted**, or **Funded**: open the form, search the lead by name, pick the event type, and enter the loan size and date. One submit per loan; the same house with two loans is two submits.

The screenshot shows a web form titled "Test test — Client log" with the WAIZ logo at the top left. The form has two tabs: "Log" (active) and "Activity". Under "What are you logging?", there are two buttons: "Conversion" (active) and "Disqualified". Below this is a "Lead" section with a "Search by name" input field and a link "Can't find this lead". The "What happened?" section has three buttons: "Proposal", "Submitted" (active), and "Funded". The "Loan size" field contains "250000". The "Transaction type" is a dropdown menu set to "Optional — select type". A note below states: "One submit per loan. Same house, two loans = two submits. Pick a type if two files are the same size the same day." The "When" field shows the date "09/28/2026" with a calendar icon. A large blue "Submit" button is at the bottom. A red speech bubble callout points to the "Submitted" button with the text: "Here is where you can select the event type".

Figure 7: Logging a conversion: pick the lead, the event type, the loan size, and the date.

Disqualifications

When a lead does not qualify, log it with the reason: LTV, FICO, low property value, seasoning, low income, or other. The optional notes box is for anything that adds context.

Figure 8: Logging a disqualification: select the reason so we know exactly what happened.

Why this matters so much

Your logged outcomes close the loop between your desk and your ad campaigns:

1. We trace every outcome back to the specific ad that produced the lead, so we can kill what produces bad leads and scale what produces good ones.
2. Cleaner outcome data lets us steer the campaigns toward the kinds of leads that actually turn into business for you, not just the ones that fill out forms.

Figure 9: The feedback loop: your two minutes of logging drives the next month of lead quality.

Your daily routine

The whole system runs on a few minutes of rhythm. Here is the cadence that keeps everything current without eating your day:

Figure 10: The operating rhythm: a few minutes at the right moments.

If you only build one habit, make it the after-call one: note, tag, next step. Everything else in the system flows from leads being touched and recorded while the conversation is still fresh.

What not to touch

The CRM is yours to work in, but a few things under the hood keep the automation and reporting running. Please check with us before changing any of these:

- Workflows and automations
- Pipeline structure: the stage names and order we set up
- The core tags (renaming *claimed* or *kill-switch* breaks tracking)
- Lead source fields
- The text templates inside the follow-up sequence
- Integration settings and user permissions

Adding things is usually fine: your own pipeline stages, notes, and field updates are all encouraged. When in doubt, ask first. It takes us thirty seconds to answer and can save

hours of untangling.

Quick answers

I did not get a notification for a new lead.

Check that push notifications are enabled for the LeadConnector app in your phone settings, and that you are logged in. If both look right, message us and we will check the notification settings on our side.

The automated texts kept going after the lead replied.

That should never happen. Flag it to us immediately with the lead's name and we will fix it the same day.

I cannot find a lead.

Search by name or phone number in Contacts. If you are looking at the pipeline, check whether a filter is applied at the top of the board.

Can I add my own leads to the CRM?

Yes, you can create contacts manually. Just know that manually added contacts do not enter the automated follow-up sequence unless we set that up for you. Ask us if you want your own lists worked by the system.

Something else?

Message us in your Slack channel or reach out to your client success contact. That is what we are here for.
